

Applied Cognition Note 2: Change Blindness

Due: Tuesday, September 15 at 11:59 PM Value: 15 points Format: 500-700 word analysis

Purpose

Analyze why a meaningful visual change can go unnoticed and distinguish change blindness from poor eyesight, forgetting, or simple distraction.

Your task

- Complete the instructor's two change-detection demonstrations and record detection time, confidence, and search strategy for each.
- Choose one real-world domain - driving, medical imaging, security monitoring, or interface design - where missed changes matter.
- Explain the role of attention, scene gist, and expectations in the miss. Include one prediction that could distinguish your explanation from an alternative.
- Recommend a cue or workflow change that improves detection without creating excessive alerts.

Required sources or materials

- Course Reader demonstration links
- Lecture: scene perception and change detection

Submit

- One PDF with the demonstration record and 500-700 word note.

Grading criteria

Criterion	Pts	Full-credit evidence
Accurate concept	4	Uses the assigned cognitive concept accurately and precisely.
Concrete evidence	4	Documents specific observations or examples rather than general impressions.
Analysis	5	Connects evidence to a defensible explanation and acknowledges a limitation.
Clarity and attribution	2	Meets length, organization, and citation expectations.

Submission standards

Upload a readable PDF unless the handout specifies another format. Include your name, course code, and assignment title. Cite borrowed ideas and retain the editable source file. The learning portal timestamp is the official submission time.
